Firm Profile

Architectural Engineering Design Group, Inc.

Architectural Engineering Design Group, Inc. was established in 2004 as a single discipline firm providing electrical engineering and lighting design services. The founders feel that the single discipline approach allows the firm to focus on our passion. Being able to hone in on our interests ultimately yields the best results.

The team members at AEDG have a specific passion for lighting design and this shines through on every project we design. We strive to work with other design team members to create the most appropriate lighting layout and fixture styles that fit within the aesthetics of the project as well as falling within the Owner's budget.

Here are just a few of the things that we believe differentiate us from your average electrical engineering firm:

LIGHTING DESIGN

- AEDG provides award winning lighting design solutions which enhance the architecture and proper illumination for the space
- Our designs consider budget, aesthetics, performance, maintenance, availability and sustainability in order to provide the most appropriate solutions
- Lighting in many facilities is over 25% of the building's energy usage – by making the right decisions this can be reduced to a more sustainable level
- With our power and lighting design expertise we are able to provide a complete technical electrical engineered system and lighting design services for a cohesive set of documents

SUSTAINABILITY

- LEED or not, we can implement lighting and electrical systems which save energy
- With our experience and knowledge we have the ability to design systems that reduce the overall energy consumption, thus reducing the cost to the end user
- We can help to specify environmentally friendly products which reduce facility maintenance as well as reducing the overall environmental impact

COORDINATION

- Proactive communication throughout the entire design and construction process
- Every project, large or small, gains our undivided attention, and through proper coordination and communication produces a set of documents on time with fewer change orders

ENGINEERING

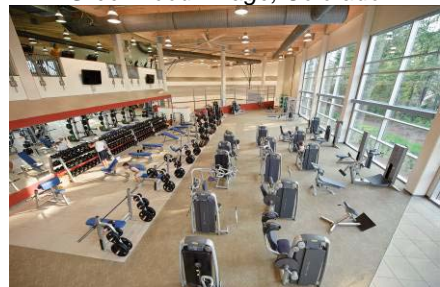

- We can provide outside the box thinking and solutions
- Early coordination of electrical space requirements with a sensitivity to overall space planning goals
